

4月17日. 周四. 第17次课.

Topic: 利用对称性计算定积分.(续).

[中文课本: 6.3. 利用对称性计算定积分. P235 ~ P241]

Calculus: Symmetry. P417 ~ P418.]

(1). 奇函数/偶函数的定积分.

定理1. 已知 $f(x)$ 是 $[-a, a]$ 上的可积函数.

<1>. 若 $f(x)$ 是奇函数. ($f(-x) = -f(x)$), 则 $\int_{-a}^a f(x) dx = 0$.

<2>. 若 $f(x)$ 是偶函数. ($f(-x) = f(x)$), 则 $\int_{-a}^a f(x) dx = 2 \cdot \int_0^a f(x) dx$.

(2). 周期函数的定积分.

定理2: 设 $f(x)$ 是 $(-\infty, +\infty)$ 上的连续函数, 且以 T 为周期. ($f(x+T) = f(x), \forall x$).

则 $\forall a \in (-\infty, +\infty)$, 有 $\int_0^T f(x) dx = \int_a^{a+T} f(x) dx$.

周期为 T 的函数 在长度为 T 的区间上积分结果总一样. (和上限, 下限无关).

定理3: 设 $f(x)$ 是 $(-\infty, +\infty)$ 上的连续函数, 且以 T 为周期. ($f(x+T) = f(x), \forall x$).

则 $\forall a, b \in (-\infty, +\infty)$, 有 $\int_{a+T}^{b+T} f(x) dx = \int_a^b f(x) dx$.

(3). 一般的轴对称、中心对称函数的定积分.

概念回顾: $f(x)$ 关于 $x=a$ 轴对称 $\Leftrightarrow f(a+x)=f(a-x), \forall x \in \mathbb{R}$

定理4. <1> 若 $f(x)$ 关于 $x=a$ 轴对称, 则 $\int_{a-b}^{a+b} f(x) dx = 2 \cdot \int_a^{a+b} f(x) dx$;

<2> 若 $f(x)$ 关于 $(a,0)$ 中心对称, 则 $\int_{a-b}^{a+b} f(x) dx = 0$.

证明略.

因此, 在遇到难以通过原函数求解的定积分 $\int_a^b f(x) dx$

可以尝试验证是否 $f(x)$ 关于 $x=\frac{a+b}{2}$ 轴对称

或 $f(x)$ 关于 $(\frac{a+b}{2}, 0)$ 中心对称.

e.g. 6. $\int_0^\pi \frac{\cos x}{\sqrt{a^2 \sin^2 x + b^2 \cos^2 x}} dx$. 把这个函数记为 $f(x)$.

验证 $f(x)$ 关于 $(\frac{\pi}{2}, 0)$ 中心对称. 只需要验证.

$$f(\frac{\pi}{2}+x) = -f(\frac{\pi}{2}-x), \quad \forall x \in [0, \frac{\pi}{2}].$$

$$\text{令 } t = \frac{\pi}{2} - x, \quad f(\pi-t) = -f(t), \quad \forall t \in [0, \frac{\pi}{2}].$$

$$\begin{aligned} \cos(\pi-t) &= -\cos t. \\ f(\pi-t) &= \frac{\cos(\pi-t)}{\sqrt{a^2 \sin^2(\pi-t) + b^2 \cos^2(\pi-t)}} = \frac{-\cos t}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}} = -f(t). \end{aligned}$$

$$\sin(\pi-t) = \sin t. \quad \therefore f(x) \text{ 关于 } (\frac{\pi}{2}, 0) \text{ 中心对称.} \quad \therefore \int_0^\pi f(x) dx = 0$$

$$= \sin t.$$

(4). 更一般情形下利用对称性求解定积分.

上述方法也可以这样理解:

$$\text{记 } I = \int_a^b f(x) dx.$$

$$\text{则 } I \stackrel{t=m+n-x}{=} \int_a^b f(m+n-t) (-dt) = \int_m^a f(m+n-t) \cdot dt.$$

$$\therefore 2I = \int_a^b [f(x) + f(m+n-x)] dx$$

这种理解方式不但能用于解决定理4中轴对称、中心对称的定积分，
还能解决更多类型的对称性定积分问题。

①. 利用对称性 进行计算

e.g.7. $I = \int_0^{\pi/2} \frac{\overset{=f(x)}{\sin x}}{\sin x + \cos x} dx.$

$$\sin(\frac{\pi}{2}-x) \quad 2I = \int_0^{\pi/2} [f(x) + f(\frac{\pi}{2}-x)] dx.$$

$$\begin{aligned} &= \cos x \\ &\cos(\frac{\pi}{2}-x) \\ &= \sin x \end{aligned} \quad f(\frac{\pi}{2}-x) = \frac{\sin(\frac{\pi}{2}-x)}{\sin(\frac{\pi}{2}-x) + \cos(\frac{\pi}{2}-x)} = \frac{\cos x}{\cos x + \sin x}. \quad f(x) + f(\frac{\pi}{2}-x) = 1$$

$$\therefore 2I = \int_0^{\pi/2} 1 dx = \frac{\pi}{2}. \quad \therefore I = \frac{\pi}{4}.$$

一些解释: 从 $f(x)$ 到 $f(m+n-x)$, 实际上是进行了一次水平方向的翻转.

在右图中, $f(x) = \frac{x \cdot \sin x}{1 + \cos^2 x}$.

$f(x)$ 与 $f(\pi-x)$ 的图象关于 $x = \frac{\pi}{2}$ 对称.

可以认为, $f(\pi-x)$ 的图象是 $f(x)$ 的图象

关于 $x = \frac{\pi}{2}$ 水平翻转后得到的.

e.g.8. 计算 $I = \int_0^{\pi} \frac{x \cdot \sin x}{1 + \cos^2 x} dx.$

$$2I = \int_0^{\pi} [f(x) + f(\pi-x)] dx.$$

$$f(\pi-x) = \frac{(\pi-x) \cdot \sin(\pi-x)}{1 + \cos^2(\pi-x)} = \frac{(\pi-x) \cdot \sin x}{1 + \cos^2 x}$$

$$\therefore f(x) + f(\pi-x) = \frac{\pi \cdot \sin x}{1 + \cos^2 x}$$

$$\therefore 2I = \int_0^\pi \frac{\pi \cdot \sin x}{1 + \cos^2 x} dx = \pi \cdot \int_0^\pi \frac{-d(\cos x)}{1 + \cos^2 x} \stackrel{t = \cos x}{=} \pi \cdot \int_1^{-1} \frac{-dt}{1+t^2}$$

$$= \pi \cdot (-\arctan t) \Big|_1^{-1} = \pi \cdot \left[\frac{\pi}{4} - \left(-\frac{\pi}{4}\right) \right] = \frac{1}{2} \pi^2$$

eg. 9. 计算 $I = \int_0^{\pi/4} \ln(1 + \tan \theta) d\theta$

$$\tan(\alpha - \beta)$$

$$2I = \int_0^{\pi/4} [f(\theta) + f(\frac{\pi}{4} - \theta)] d\theta$$

$$= \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$$

$$f(\frac{\pi}{4} - \theta) = \ln[1 + \tan(\frac{\pi}{4} - \theta)] = \ln \left[1 + \frac{1 - \tan \theta}{1 + \tan \theta} \right] = \ln \frac{2}{1 + \tan \theta}$$

$$f(\theta) + f(\frac{\pi}{4} - \theta) = \ln 2$$

$$\ln(a \cdot b)$$

$$\therefore 2I = \int_0^{\pi/4} \ln 2 d\theta = \frac{\pi}{4} \cdot \ln 2$$

$$= \ln a + \ln b$$

$$\therefore I = \frac{\pi}{8} \cdot \ln 2$$

有时候, 还需要结合换元积分法, 才能用对称性求定积分.

(*) eg. 9+ 计算 $I = \int_0^1 \frac{\ln(x+1)}{x^2+1} dx$

①. $x = \tan \theta$; ②. $x = \frac{1-u}{1+u}$

①. 令 $x = \tan \theta$. $I = \int_0^1 \ln(x+1) d(\arctan x) = \int_0^{\pi/4} \ln(\tan \theta + 1) d\theta$

②. 令 $x = \frac{1-u}{1+u}$ $x \cdot (1+u) = 1-u$ $(x+1) \cdot u = 1-x$ $\therefore u = \frac{1-x}{1+x}$

$$I = \int_1^0 \frac{\ln(\frac{1-u}{1+u} + 1)}{\left(\frac{1-u}{1+u}\right)^2 + 1} d\left(\frac{1-u}{1+u}\right)$$

②. 利用对称性 证明等式:

主要通过换元进行证明.

eg. 10: 证明 $\int_0^{\pi/2} f(\sin x) dx = \int_0^{\pi/2} f(\cos x) dx$

$$\int_0^{\pi/2} f(\sin x) dx \xrightarrow{t=\pi/2-x} \int_{\pi/2}^0 f(\sin(\frac{\pi}{2}-t)) \cdot d(\frac{\pi}{2}-t)$$

$$= \int_{\pi/2}^0 f(\cos t) \cdot (-dt) = \int_0^{\pi/2} f(\cos t) \cdot dt$$

$$= \int_0^{\pi/2} f(\cos x) \cdot dx$$

eg. 11: 证明: $I = \int_0^{\pi} x \cdot f(\sin x) \cdot dx = \pi \cdot \int_0^{\pi/2} f(\sin x) \cdot dx$. (e.g. 8 的推广)

令 $x = \pi - t$. $\therefore I = \int_{\pi}^0 (\pi - t) \cdot f(\sin(\pi - t)) \cdot d(\pi - t)$.

$$= \int_{\pi}^0 (\pi - t) \cdot f(\sin t) (-dt)$$

$$= \int_0^{\pi} (\pi - t) \cdot f(\sin t) \cdot dt$$

$$= \int_0^{\pi} (\pi - x) f(\sin x) dx$$

$$\therefore 2I = \int_0^{\pi} [x \cdot f(\sin x) + (\pi - x) \cdot f(\sin x)] dx$$

$$= \pi \cdot \int_0^{\pi} f(\sin x) \cdot dx$$

再证明 $\int_{\pi/2}^{\pi} f(\sin x) dx = \int_0^{\pi/2} f(\sin x) dx$.

就可证明 $I = \pi \cdot \int_0^{\pi/2} f(\sin x) dx$.

$$\int_{\pi/2}^{\pi} f(\sin x) dx \xrightarrow{t=\pi-x} \int_{\pi/2}^0 f(\sin(\pi-t)) d(\pi-t)$$

$$= \int_{\pi/2}^0 f(\sin t) \cdot (-dt)$$

$$= \int_0^{\pi/2} f(\sin t) \cdot dt = \int_0^{\pi/2} f(\sin x) dx.$$

Try it!

①. 求 $I_1 = \int_0^{\pi} x \cdot \sin^2 x dx$. ②. 求 $I = \int_0^1 \frac{x^2}{x^2 + (1-x)^2} dx$.

①. 直接用 e.g. 11 的结果: $\int_0^{\pi} x \cdot f(\sin x) dx = \pi \cdot \int_0^{\pi/2} f(\sin x) dx$.

$$\text{令 } f(x) = x^n. \quad I_n = \int_0^{\pi} x \cdot \sin^n x dx = \pi \cdot \int_0^{\pi/2} \sin^n x \cdot dx$$

$$= \begin{cases} \pi \cdot \frac{(n-1)!!}{n!!} & n \text{ 为奇数} \\ \pi \cdot \frac{(n-1)!!}{n!!} \cdot \frac{\pi}{2} & n \text{ 为偶数} \end{cases}$$

②. 让 $f(x) = \frac{x^2}{x^2 + (1-x)^2}$, $\therefore I = \int_0^1 f(x) dx$.

$$\therefore 2I = \int_0^1 [f(x) + f(1-x)] dx.$$

$$= \int_0^1 \left[\frac{x^2}{x^2 + (1-x)^2} + \frac{(1-x)^2}{(1-x)^2 + x^2} \right] dx$$

$$= \int_0^1 1 dx$$

$$= 1.$$

$$\therefore I = \frac{1}{2}.$$
